

DIY PROJECT "DUAL TUBE PREAMP GYRAF G9"

HOW TO CONNECT THE POWER TRANSFORMERS WITH THE PCB

HINTS:

Be careful with the voltages!

When you're fumbling with your fingers in the gear. You could put a bulb in series with the gear... when there is too much current you'll have a bit time to switch off.. if something is wrong.

On the cables from the toroid transformer is a laquer... which has to be removed before wiring... otherwise.. no contact!
